In general, there are three storage pillars: internal storage: the internal rigid disk for your mobile phone or external storage computer: further local storage such as SD micro cards, USB sticks and external strict discs cloud storage: storage from cloud suppliers (See above for examples) that can be free or purchased your mobile phone use all three storage pillars. On an Android phone, some things can be stored on the phone itself à € "which is the internal storage. Other things are stored on the micro sd card à € "which is external storage. And the data for applications can be stored in the cloud. Connect your storage: collect the external rigid discs and the thumb units. (I have an external hard drive 4 terabyte and half a dozen USB thumb unit which are very, much small.) Connect these devices and then use file manager in Windows or Finder in macOS to investigate how they work. Click with the right mouse button on the units and view the individual properties. You will learn a little. Explore the file manager: on your phone, file manager applications can help you find out how your internal and external storage works. 5. Computer network before being able to solve a network problem, you have to understand how it works. To do this, the connections from the internet device on a piece of paper. You can also install applications on your phone to find out more about how network devices work. On the phone, you will find a series of network devices inside: Wi-Fi Radiocellular RadioCommunication on the field (NFC) Global positioning system (GPS) Bluetooth after discovering what and as the network, it is therefore possible to deepen more deeply on the net example, you can download one of many network scanner applications on your phone, such as Network Scanner, shown in Figure 5. Figure 5: Network scanners on my Android In Figure 5, above, I conducted a quick scanMy home network using the network scanner app. He found my cable modem, some intelligent LED lights (viz 3baa74.lan) and an HP printer that enabled wireless printing (HP009c02cfe0b3). Download and install apps on your phone: here are some apps that will help you learn a lot on the network you connected to. Apps Android Apps Apps Cellular Z: provides a nice interface for your mobile and wi-fi interfaces. Ping or Scanny: similar to Cellular Z, these apps provide statistics for mobile and wi-fi connections. They also lead network scans. Scanner: Wi-Fi scans and mobile networks to identify all devices on your network. Dr. Wi-Fi: allows you to investigate the local Wi-Fi network connection. Figure 6 shows how cell Z has identified several Wi-Fi access points in my home mesh network. Figure 6: Cellular Z Install a terminal application: once connected to a network, you can install one of the applications of the terminal that we discussed in the Operating Systems section. Using this terminal, I can use problems resolution applications such as Ping, ARP, Host and Traceroute. Discover your network: use these apps to learn the following: the quality of the connection for your Wi-Fi and mobile tower the number of systems connected to the Wi-Fi access wi-fit number that are located near the number Of the nearby furniture towers strengthen your new technological qualities, the logical follow-up to how to learn the technological qualities is how to remember them so that you can use them at work. Here are some suggestions to make sure that your new skills are based: break the larger skills in small elements to better understand how everything works together. After reading and exploring, applying your new practical qualities while they are fresh in your mind. Test and try again - it is things and repair them. If you don't get things the right way the first time, start over and try again.
